

Privacy-Preserving LLM-Based Legal and Financial Guidance System for Rural Communities

This project proposes an LLM-based intelligent guidance system designed to help people, particularly those in rural and underserved communities, understand and respond to common legal and financial problems. Many individuals may face difficulties in understanding banking disputes, financial transactions, cyber-fraud complaints, consumer issues, and other legal procedures because of limited awareness, complicated terminology, language barriers, or lack of immediate access to professional guidance.

The proposed system allows users to describe their problem in natural language or through voice input. The LLM analyzes the user's situation, identifies the relevant issue categories, asks necessary follow-up questions, and generates a structured summary of the problem. Instead of directly deciding who is legally right or wrong, the system provides possible courses of action, explains relevant procedures in simple language, identifies documents or evidence that may be useful, and guides the user toward the appropriate official authority or professional assistance.

The system can use Retrieval-Augmented Generation (RAG) with trusted and verified sources to reduce incorrect or outdated responses. It can also support regional languages to make the system more accessible to users who are not comfortable communicating in English.

Privacy is a major component of the proposed system because users may provide sensitive financial or legal information. The system will follow a data-minimization approach and provide a user-controlled **"Delete My Case"** feature. When the user chooses to delete their case, the application will remove the associated conversation, generated case information, and uploaded documents from the application's storage. The system will also provide a privacy mode in which information is processed without being permanently stored by the application, subject to the retention policies of any external services used by the implementation.

The overall objective is to develop a safe, accessible, privacy-conscious LLM assistant that helps users understand their problems and identify appropriate next steps without replacing qualified lawyers, financial professionals, banks, police, or other authorized authorities.
